Congratulations! You passed! Go to next item **Grade received 100%** Latest Submission Grade 100% To pass 78% or higher 1. Which of the following represents the derivative of a function f(x) (check all that apply)? 1/1 point \square F(x) $\checkmark f'(x)$ **✓** Correct Correct! $\Box f'(x^2)$ **⊘** Correct Correct! This is known as the Leibniz notation. 2. Consider the graph of the following function f(x). 1/1 point 9.0 8.1 7.2 6.3 5.4 **≥** 4.5 3.6 2.7 1.8 0.9 0.0 0.5 2.0 2.5 3.0 3.5 4.0 4.5 0.0 Regarding **its derivative**, f'(x), where $x \in [0,5]$: (check all that apply) $\Box f'(x)$ is always positive. lacksquare f'(x) has three zeros, i.e., f'(x)=0 three times. Correct Correct! f has two local minima and one local maximum in the interval. f'(1) < 0.**⊘** Correct Correct! f is decreasing when x=1, therefore its derivative must be negative at this point. f'(4) > 0.Correct Correct. f is increasing when x=4, therefore its derivative must be positive at this point. **3.** What is the derivative of $3x^3-2x+1$? 1/1 point $\bigcirc 3x^2-2$ $\bigcirc 9x^2-2+1$ $\bigcirc 9x^3-1$ **⊘** Correct Correct! **4.** Suppose you have a game where you toss a coin 20 times and win if you get, in this exact order, 16 heads and 4 tails. However, in this game, you can choose 1/1 point any coin and toss it 20 times. Which of the following functions you need to maximize in order to find the best coin for this game? Consider p being the probability of a given coin being heads. $16\log(p) + 4\log(p)$ $\bigcirc \ 4\log(p) + 16\log(1-p)$ $\bigcirc 4\log(1-p) + 16\log(1-p)$ **⊘** Correct Correct! The probability of having 16 heads is p^{16} and the probability of having 4 tails is $(1-p)^4$, therefore the total desired probability is $l(p)=p^{16}(1-p)^4$. As you saw in the lecture Cost Functions in machine Learning - Part II $oxedsymbol{L}$, the same value that maximizes l, also maximizes $\log l$ and $\log l = 16\log(p) + 4\log(1-p)$. 5. Let f(x) be a real valued function with the following graph. In the interval [0,7], how many zeros has its derivative f'(x)? 1/1 point 2.0 1.6 1.2 0.8 0.4 1 4 5,6 6 3 -0.4-0.8-1.2-1.6-2.0**⊘** Correct Correct! Since f has 3 local minima and 2 local maxima in the desired interval, it must have 5 zeros. You can review the lecture **6.** If f(x) and g(x) are differentiable functions, then the derivative of f(x)g(x) is given by: 1/1 point $\bigcap f'(x) \cdot g'(x) + f(x) \cdot g(x)$ $\bigcap f'(x) \cdot g(x) - f(x) \cdot g'(x)$ $\bigcap f'(x) \cdot g'(x)$ **⊘** Correct Correct! 7. The rate of change of $f(x)=x^2+3$ at x=6 is: 1/1 point 12 Correct Correct! f'(x) = 2x, therefore $f'(6) = 2 \cdot 6 = 12$. 8. Let f(x) be a **positive** real function and $g(x) = \log f(x)$. 1/1 point Check all that apply. If x_{max} is a point where $f(x_{max})$ is a local maximum, then $g(x_{max})$ is also a local **maximum**. Correct Correct! When applying the function log to f, even though we change its shape, the maximum points will remain the same, since \log is a **crescent** function! lacksquare If x_{max} is a point where $f(x_{max})$ is a local maximum, then $g(x_{max})$ is also a local **minimum**. If f(x) is differentiable, then so is g(x). **⊘** Correct Correct! The result of composing two differentiable functions is differentiable, by the **chain rule**. **9.** Using the **chain rule**, the derivative of e^{-x} is: 1/1 point $\bigcirc e^{-x}$ **⊘** Correct Correct!
